

**Fourteenth Semiannual Progress Report – Selection of Remedy
Huntley Generating Station—Huntley Power LLC
South Settling Pond
Tonawanda, New York**

Following completion of the Assessment of Corrective Measures Report (ACM Report) on August 31, 2019 (specific to arsenic) and per the requirements of 40 CFR §257.97(a), this document represents the fourteenth semiannual progress report (for the period ending July 31, 2026) with regard to the ongoing CCR remedy selection process for the South Settling Pond at the Huntley Generating Station. In addition, this progress report now also encompasses the status of remedy selection for lithium, which was the subject of a subsequent ACM Report completed on March 12, 2021. However, and despite lithium being measured above CCR groundwater protection standards, arsenic has remained the principal driver for future remediation activities at the site. In this regard, it is desired that the ultimate treatment technology selected will be dually effective for both of these CCR Appendix IV constituents.

As outlined in each of the ACM Reports, a portion of the Huntley Station property (referred to as the South Parcel) was enrolled in the New York State Department of Environmental Conservation (NYSDEC) Brownfield Cleanup Program (BCP) in February 2019. The limits of the South Parcel encompass the South Settling Pond, and thus the CCR remedy selection efforts for both arsenic and lithium maintain a significant inter-dependency with the findings, outcome and corresponding BCP remedy evaluation activities.

Below is a historical account of CCR and BCP efforts to date, inclusive of the reporting period.

With respect to the BCP, the NYSDEC-Region 9 issued a Fact Sheet (previously attached to the first semiannual progress report; January 2020) that provided an overview of the South Parcel (NYSDEC Site No. C915337) and advertised a public comment period on the Remedial Investigation Work Plan (RIWP). The final approved RIWP was issued in late-July 2020, with supporting field work and sampling initially performed during October-November 2020, followed by a second round of field work conducted July and September 2021 to address identified data gaps. In mid-January 2022, Huntley Power LLC met with the NYSDEC to discuss preliminary remedial strategies under the BCP and provide an overview of the elements being considered as part of a conceptual remedy under the CCR framework.

These efforts resulted in submittal of a draft RI Report to the NYSDEC in early-May 2022, and submittal of a draft Alternatives Analysis Report & Remedial Action Work Plan (AAR/RAWP) on June 28, 2022. Within this latter document, various remedial options were presented, with identification of a proposed remedy for soils and groundwater, including a remediation strategy for the South Settling Pond that is responsive to the CCR Rule. NYSDEC's comments on the draft AAR/RAWP were received on November 29, 2022, and were addressed during early-2023 through collection of additional arsenic groundwater data and performance of limited hydraulic conductivity analyses on selected subsurface soils. These supplemental results, which were compiled into a revised

RI Report and submitted to the NYSDEC on April 19, 2023, provided ample evidence that the proposed phytoremediation technology (as documented in the draft AAR/RAWP for managing arsenic in groundwater) would not be effective under the present site conditions. Following this submittal, subsequent additional comments were received from NYSDEC regarding arsenic remediation and the need for further characterization of the eastern berm soil materials prior to their potential use as on-site backfill during overall remedy implementation.

In response to these NYSDEC comments, and in cooperation with the NYSDEC, a Bench Study Work Plan was submitted to the NYSDEC in June 2023. The work plan encompassed further characterization of the eastern berm soils and performance of a focused bench study to examine the potential effectiveness of various arsenic fixation technologies to address the groundwater.

Huntley Power completed the evaluation of alternative arsenic fixation technologies and submitted the corresponding report to the NYSDEC on February 17, 2025. Comments from the NYSDEC were received on April 1, 2025. The NYSDEC's comments do not require revisions to the report at this time, unless arsenic fixation is ultimately selected as a remedial option.

Huntley Power received NYSDEC approval for a 100-ton trial burn of CCR-related soils on February 14, 2025, and subsequently shipped 111 tons to St. Marys Cement on March 11, 2025. Following discussions with St. Marys Cement, it was determined that a longer trial run would be beneficial. At their request, NYSDEC approved an additional 800 tons for the extended trial. Huntley Power shipped an additional 807 tons of CCR-related soils to St. Marys Cement between April 15 and April 24, 2025.

On the east side of the BCP, there is a berm containing CCR material. On October 3, 2024, Huntley Power submitted the IRM for berm removal. NYSDEC provided comments on November 27, 2024. Huntley Power resubmitted the IRM on January 20, 2025, addressing NYSDEC's comments. NYSDEC approved the IRM on July 7, 2025, and a fact sheet was issued on July 9, 2025. Field activities commenced on September 23, 2025. Approximately 12,502 tons of material has been shipped for disposal. Both berms have been completely removed as of May 2026.

Huntley Power submitted the IRM for petroleum impacts to the NYSDEC on June 28, 2024. NYSDEC provided comments on August 1, 2024. A revised IRM recommending removal and disposal of impacted material was submitted on October 3, 2024, followed by additional NYSDEC comments received on November 19, 2024. Huntley Power resubmitted the IRM on March 31, 2025, addressing all comments, and received approval to proceed on April 1, 2025. In addition to the removal of petroleum impacted material, free product recovery activities collected and shipped 2,661 gallons of fuel oil for recycling.

Field activities for removal of impacted material began in June 2025. Between July and December 2025, a total of 36,368 tons of impacted material were removed and disposed of. On December 10, 2025, the Northwestern PIA was verified as clean, and NYSDEC granted approval to initiate backfilling. Air monitoring is conducted during excavation activities. Air sampling results have consistently met project criteria, and no work interruptions have occurred due to air quality concerns. On days when material is shipped, a water truck is primarily used to wet plant roadways to control

dust. During this reporting period, backfilling activities began, and approximately 12,800 tons of quarry stone were placed for backfill. The remainder will be backfilled and graded per the final plan outlined in the RAWP.

Following the June 2024 meeting with NYSDEC, it was agreed that Huntley Power would submit IRM plans to address current site conditions. As a result, revisions to the AAR/RAWP were placed on hold while the following tasks were undertaken: (1) investigation of potential fill sources for the South Pond, and (2) evaluation of the potential impacts of the EPA CCR Legacy Rule on the Huntley BCP approach.

On May 8, 2026, Huntley Power met with the NYSDEC to discuss the revised RAWP/ARR. Following the meeting, the revised RAWP/ARR was submitted to the NYSDEC for review on May 29, 2026. The revised RAWP proposes the complete removal of CCR from the impoundment, as well as the removal of CCR located beneath and west of the existing pond. This approach is intended to achieve a clean closure of the impoundment in accordance with NYSDEC requirements.

Concurrent with the above and as required, Huntley Power will continue to conduct groundwater Assessment Monitoring events for the South Settling Pond. The next semiannual remedy selection progress report will provide an update for the period covering August 1, 2026 through January 31, 2027.
